Data Magic off the Pitch

Name: Aman Manish Valera

Introduction

- Cricket is often dubbed as a religion in India, and Indian Premier League (IPL) has a massive fan base.
- Providing fans with insights and inspiring more projects in the field of cricket analytics.
- With around 61 million players on fantasy gaming platforms, the IPL 2023 generated revenue of over 335 million USD

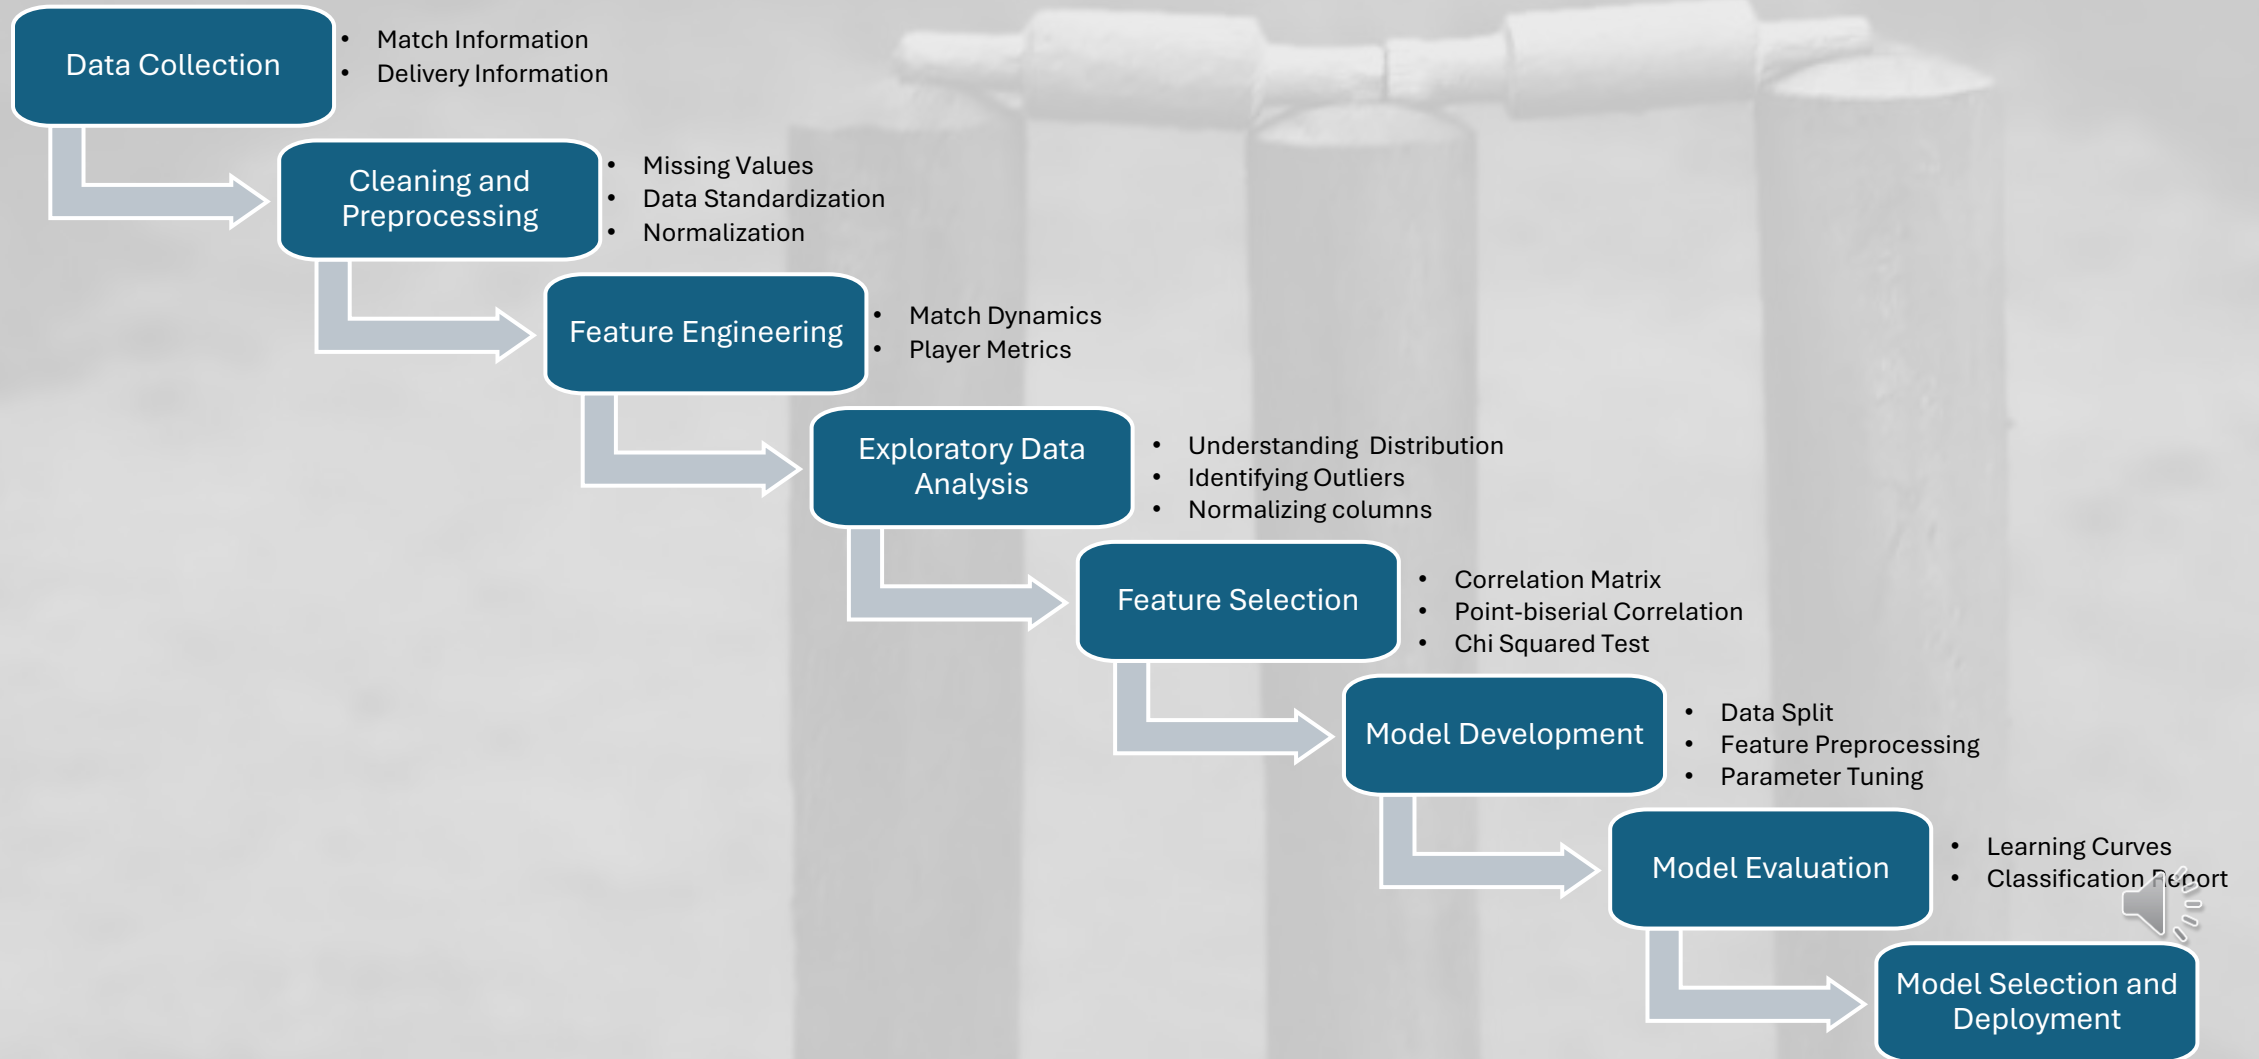

Objectives

- Predicting winner of an IPL match at a given point of time in real-time using machine learning based on historical data.
- To analyse how much impact various factors have on the match outcomes.

Methodology

Data Collection

- Match Information
- Delivery Information

Cleaning and Preprocessing

- Missing Values
- Data Standardization
- Normalization

Feature Engineering

- Match Dynamics
- Player Metrics

Exploratory Data Analysis

- Understanding Distribution
- Identifying Outliers
- Normalizing columns

Feature Selection

- Correlation Matrix
- Point-biserial Correlation
- Chi Squared Test

Model Development

- Data Split
- Feature Preprocessing
- Parameter Tuning

Model Evaluation

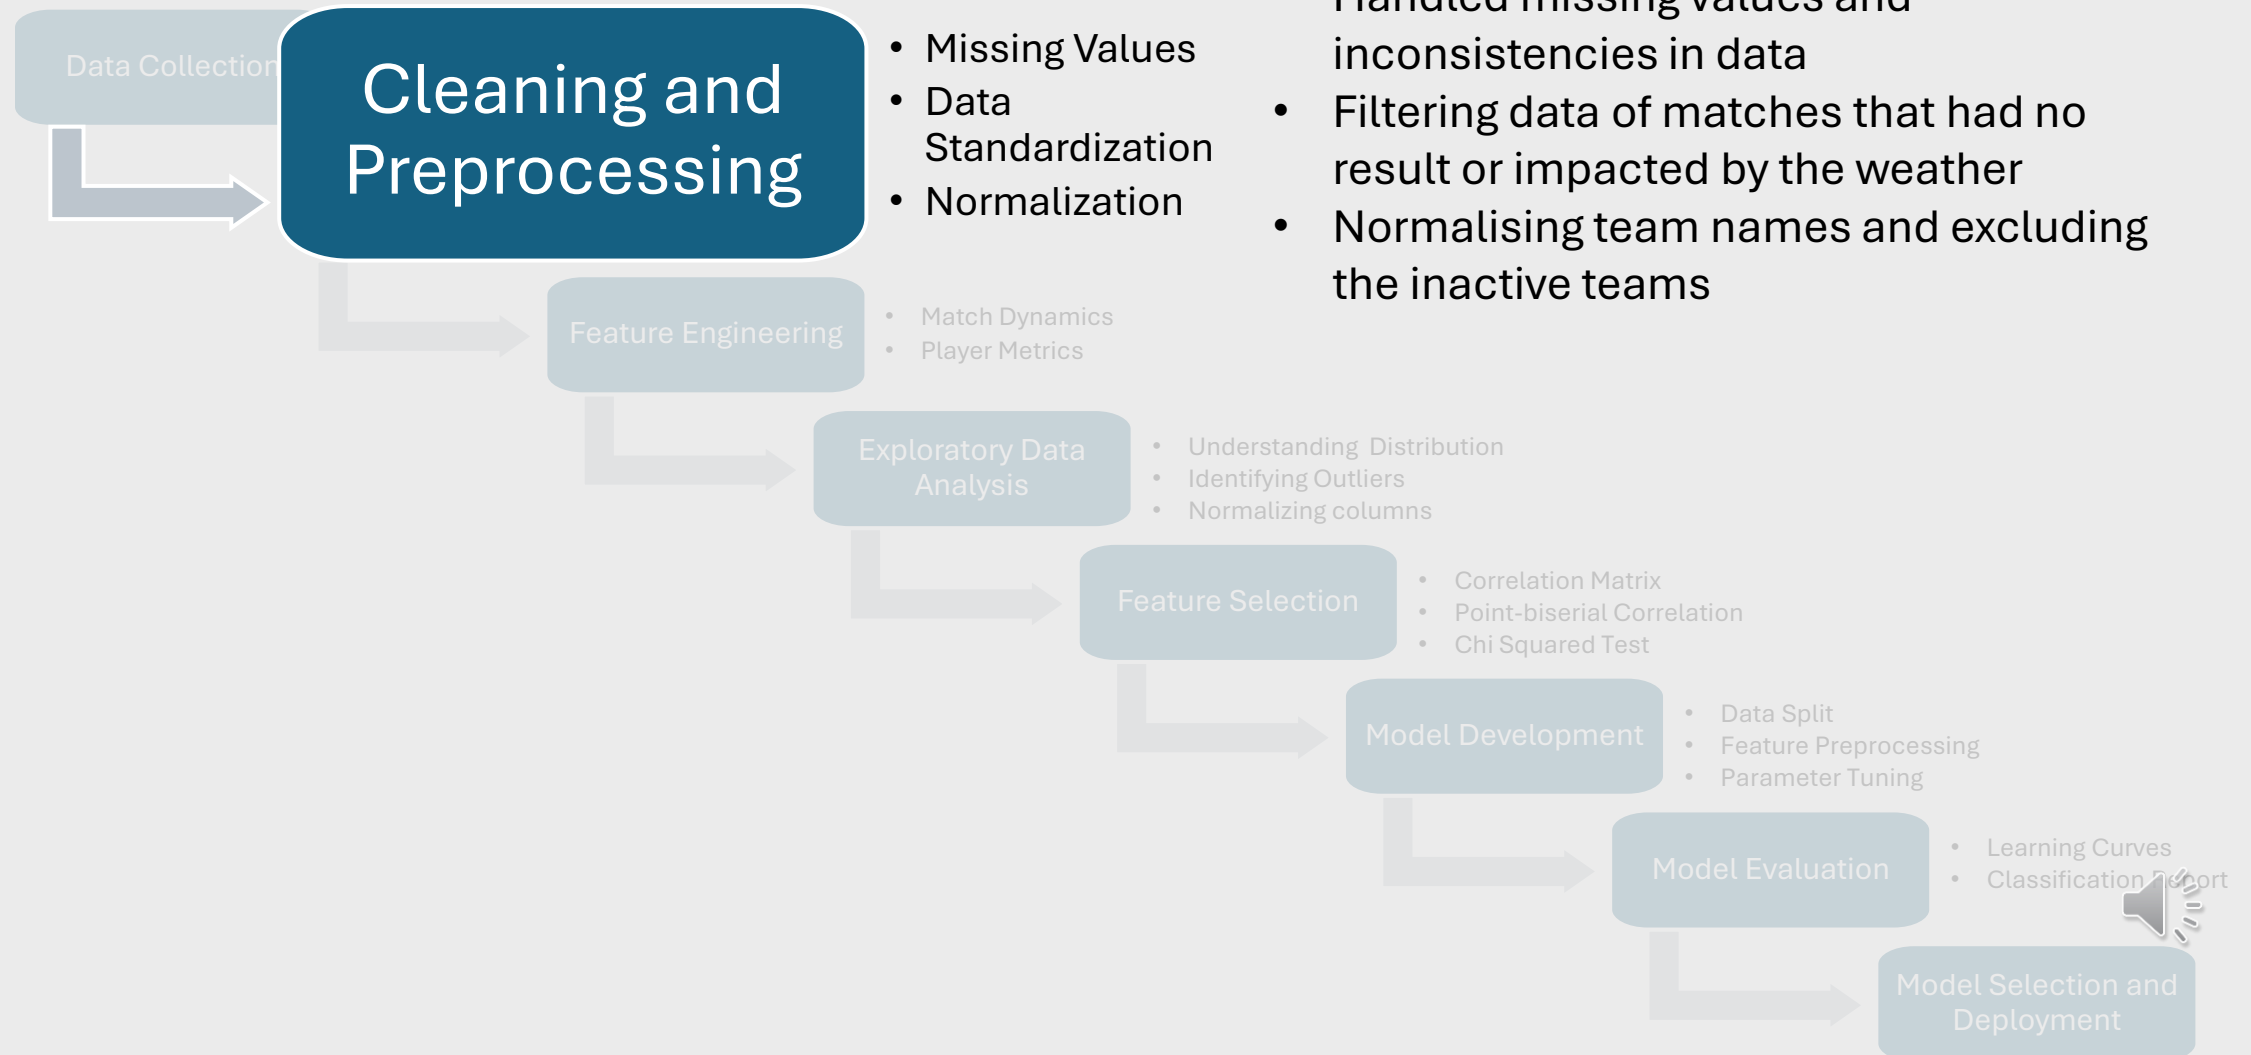

- Learning Curves
- Classification Report

Model Selection and Deployment

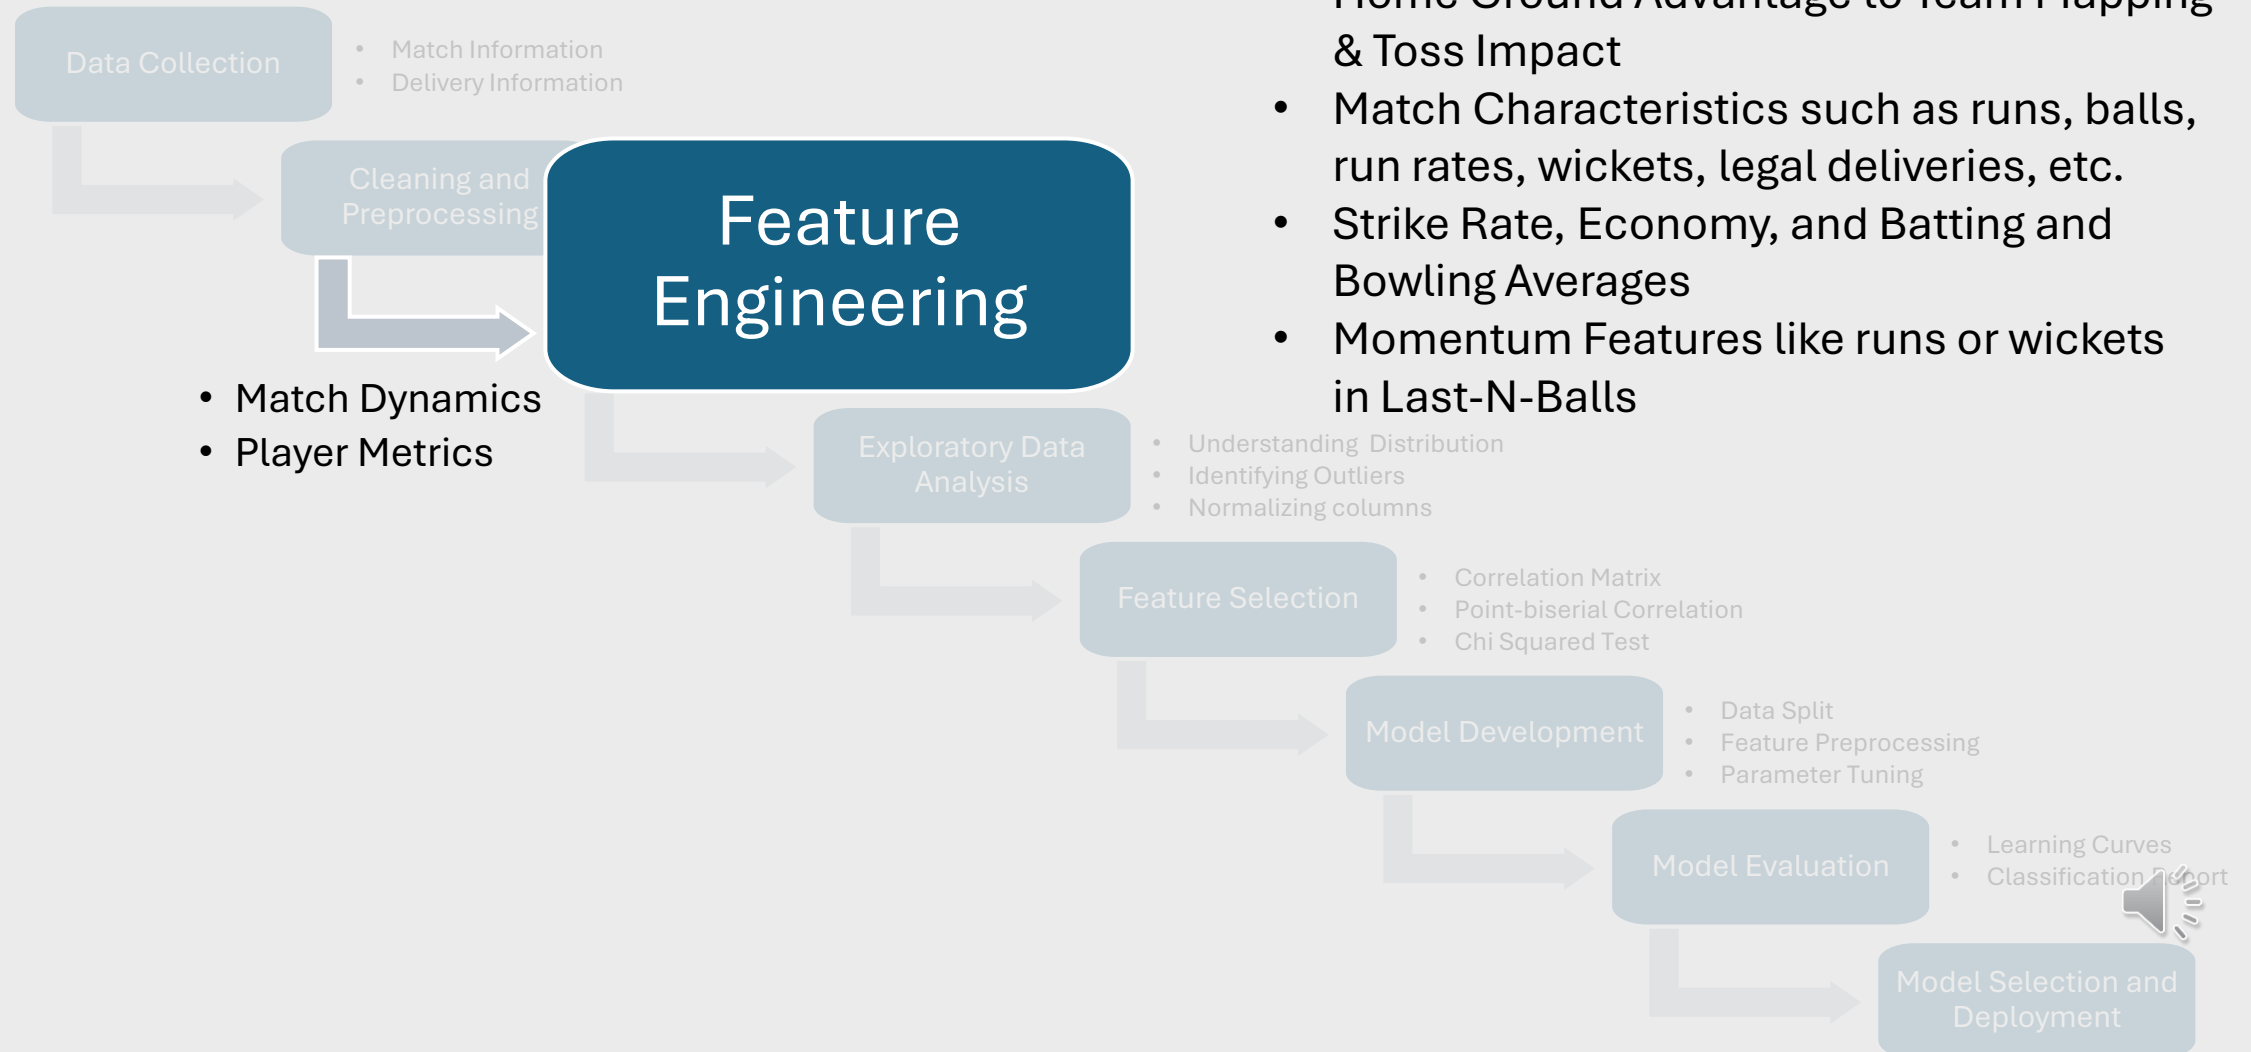

Automated Data Extraction

- Toss Information, Location, Team and Player Information
- Ball-By-Ball Information of runs, dismissals, deliveries

Preprocessing

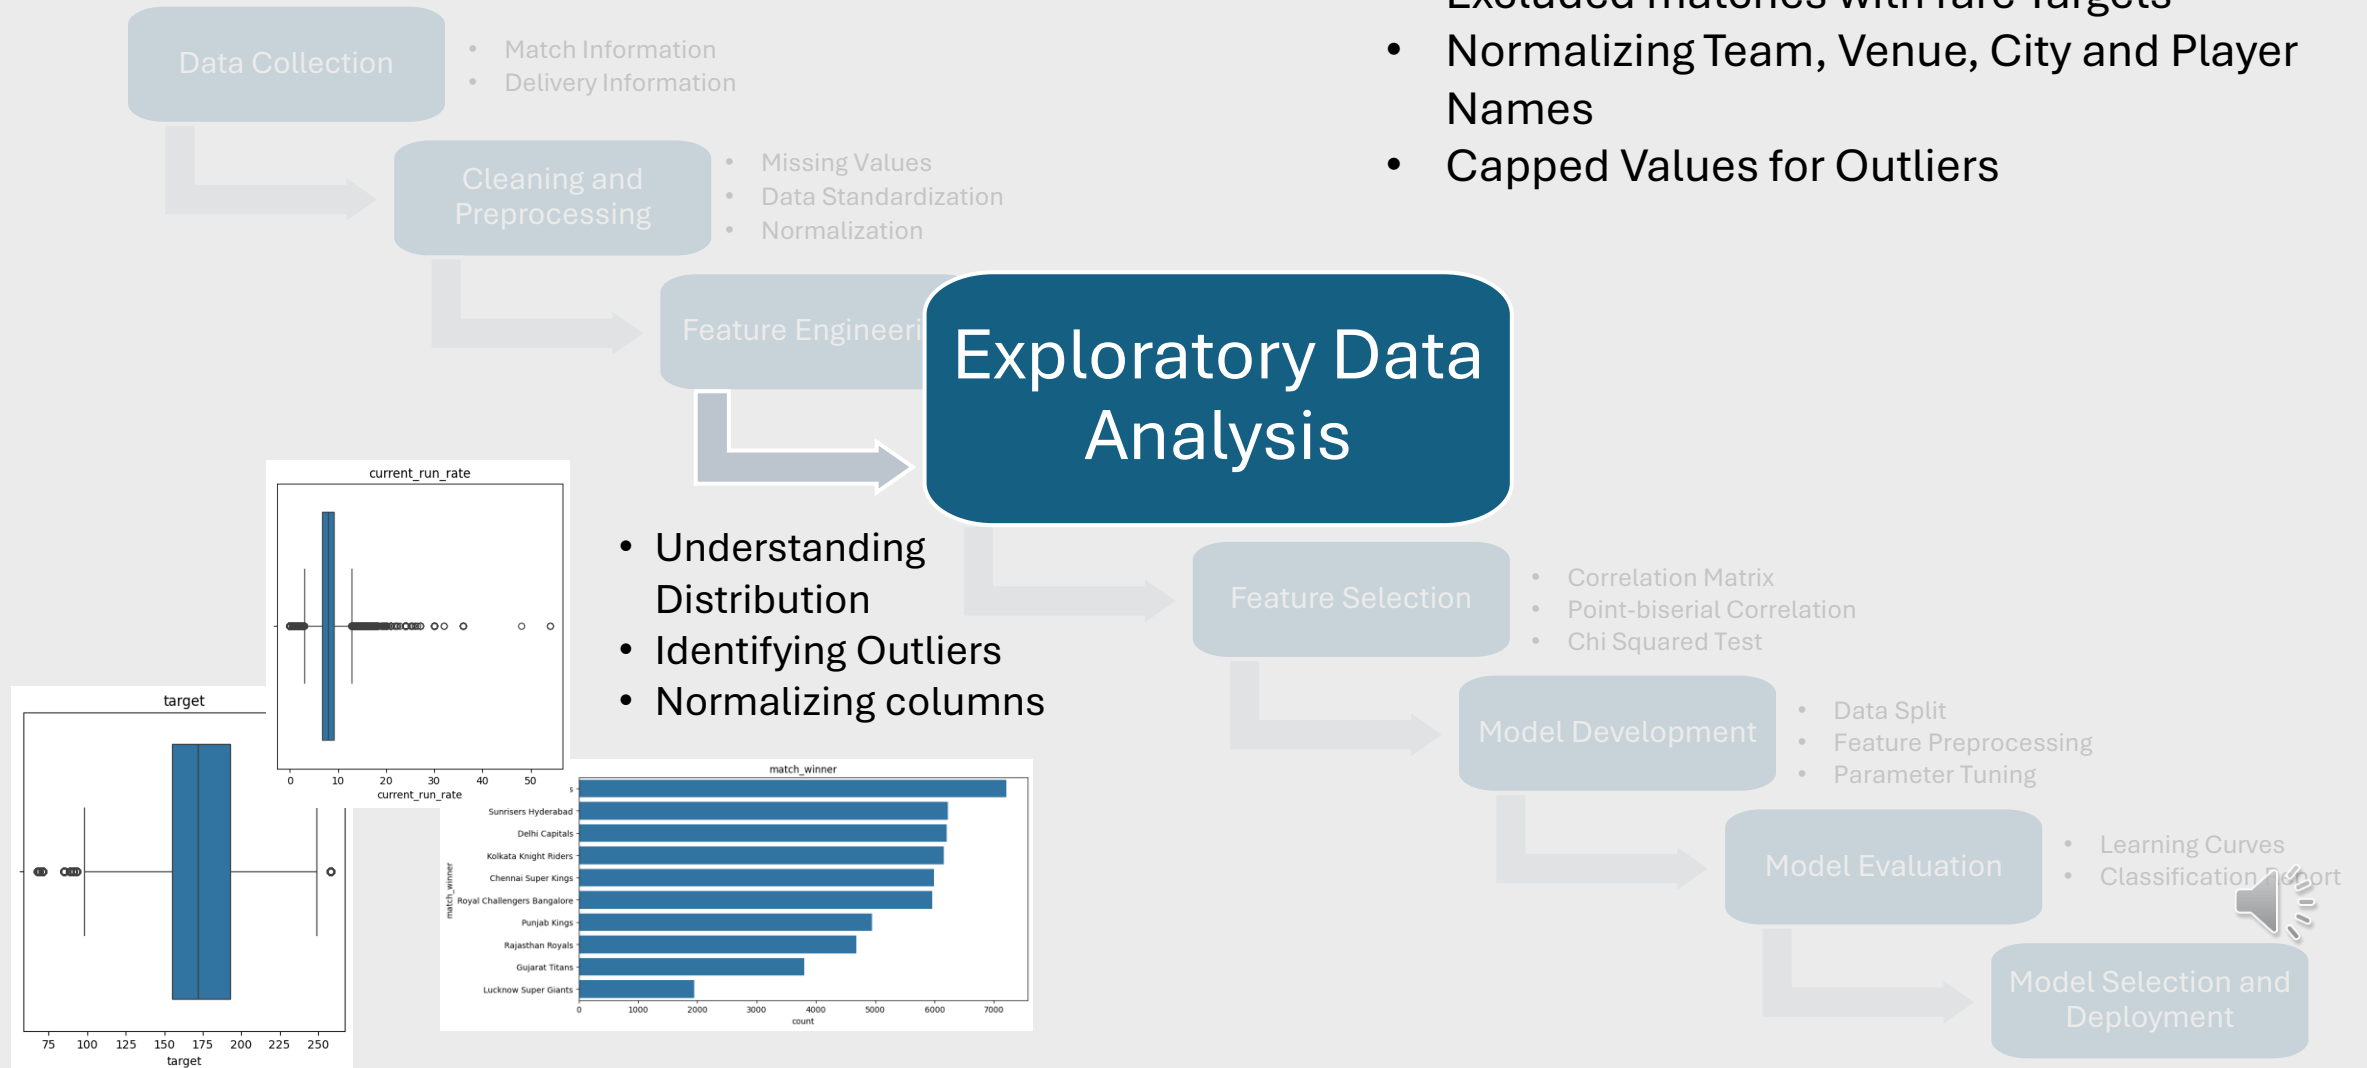

Feature Engineering

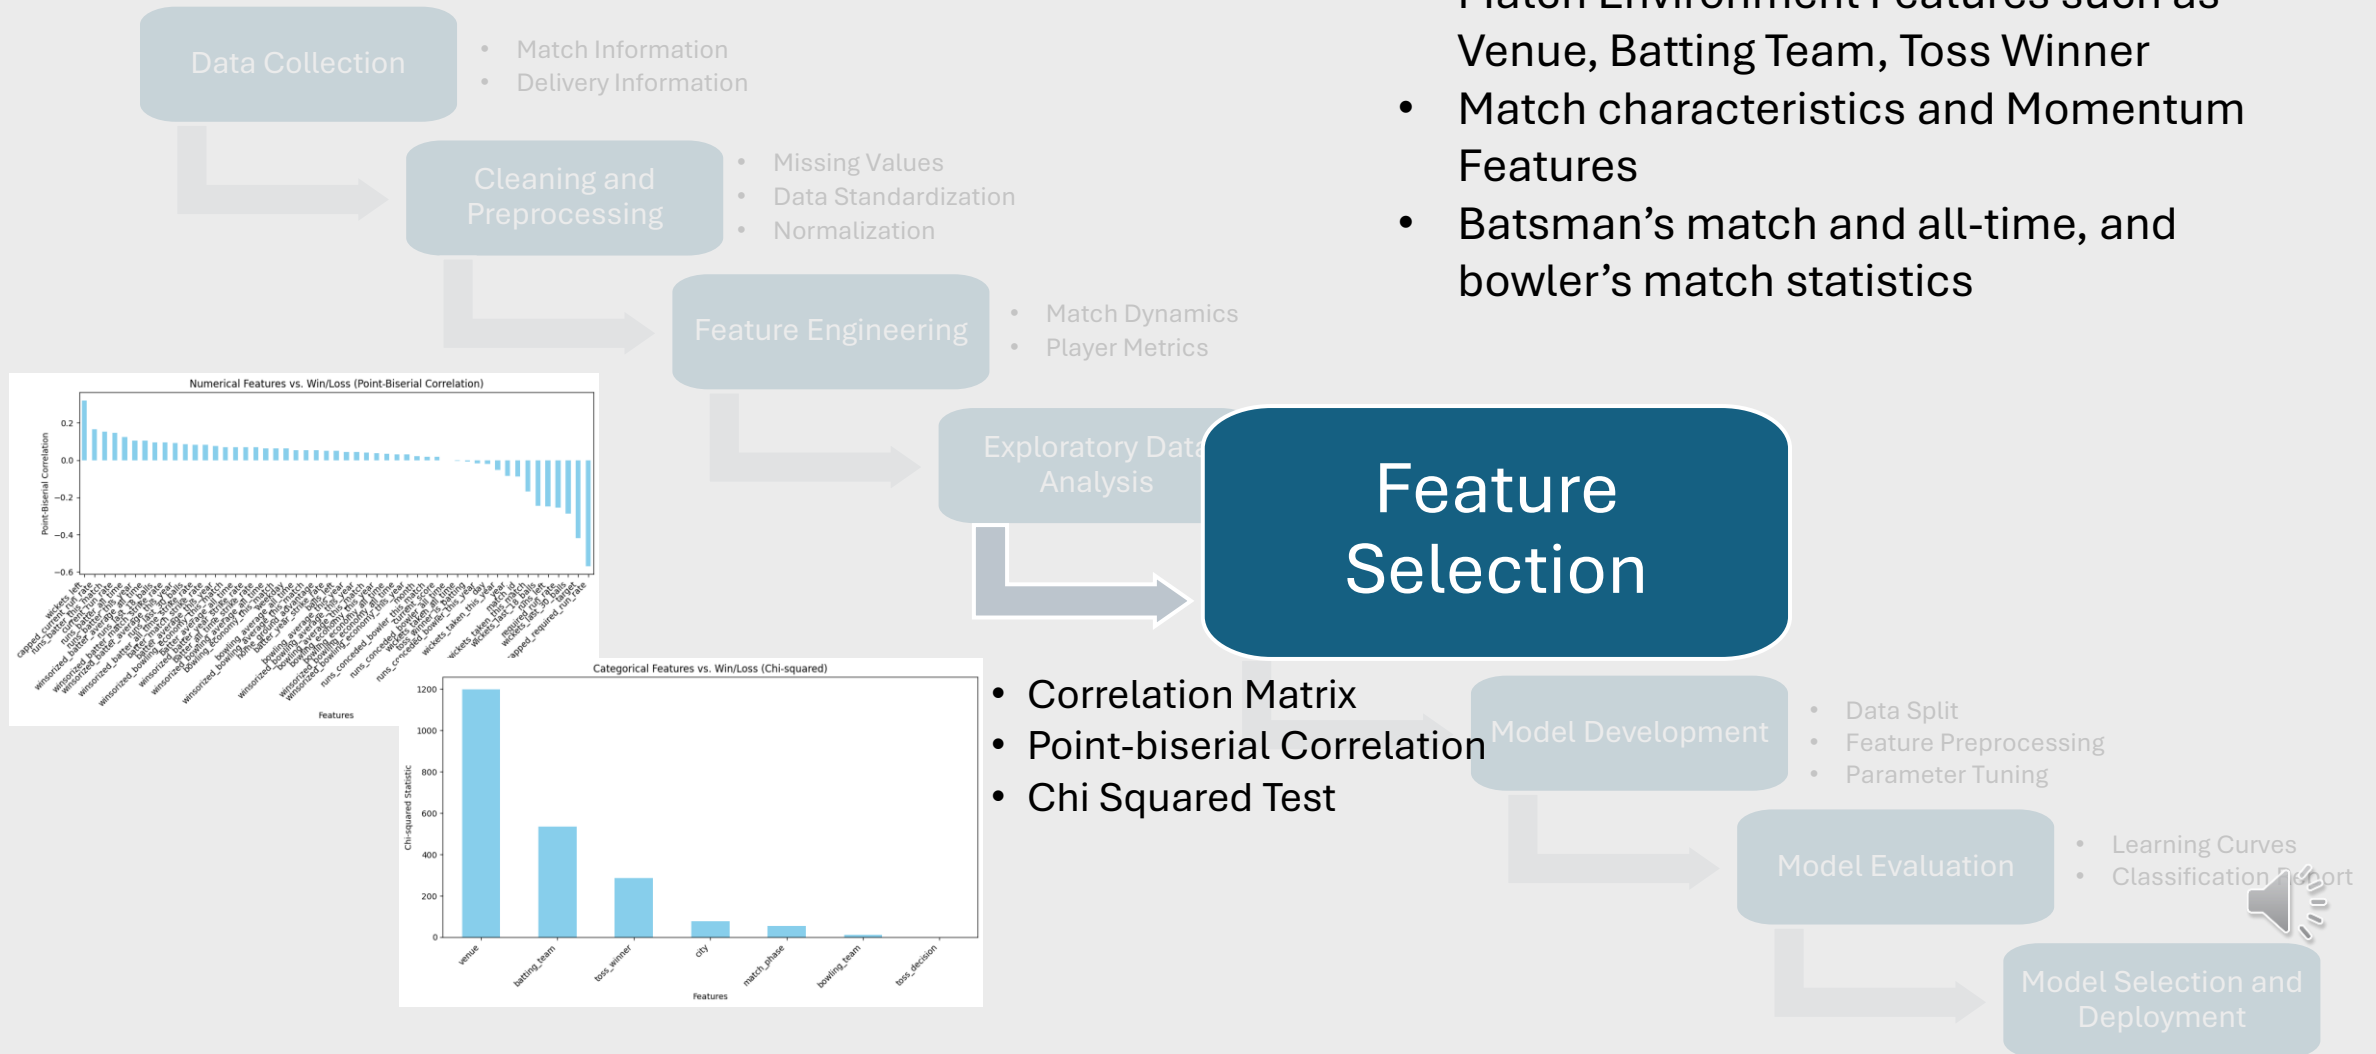

EDA

- Excluded matches with rare Targets
- Normalizing Team, Venue, City and Player Names
- Capped Values for Outliers

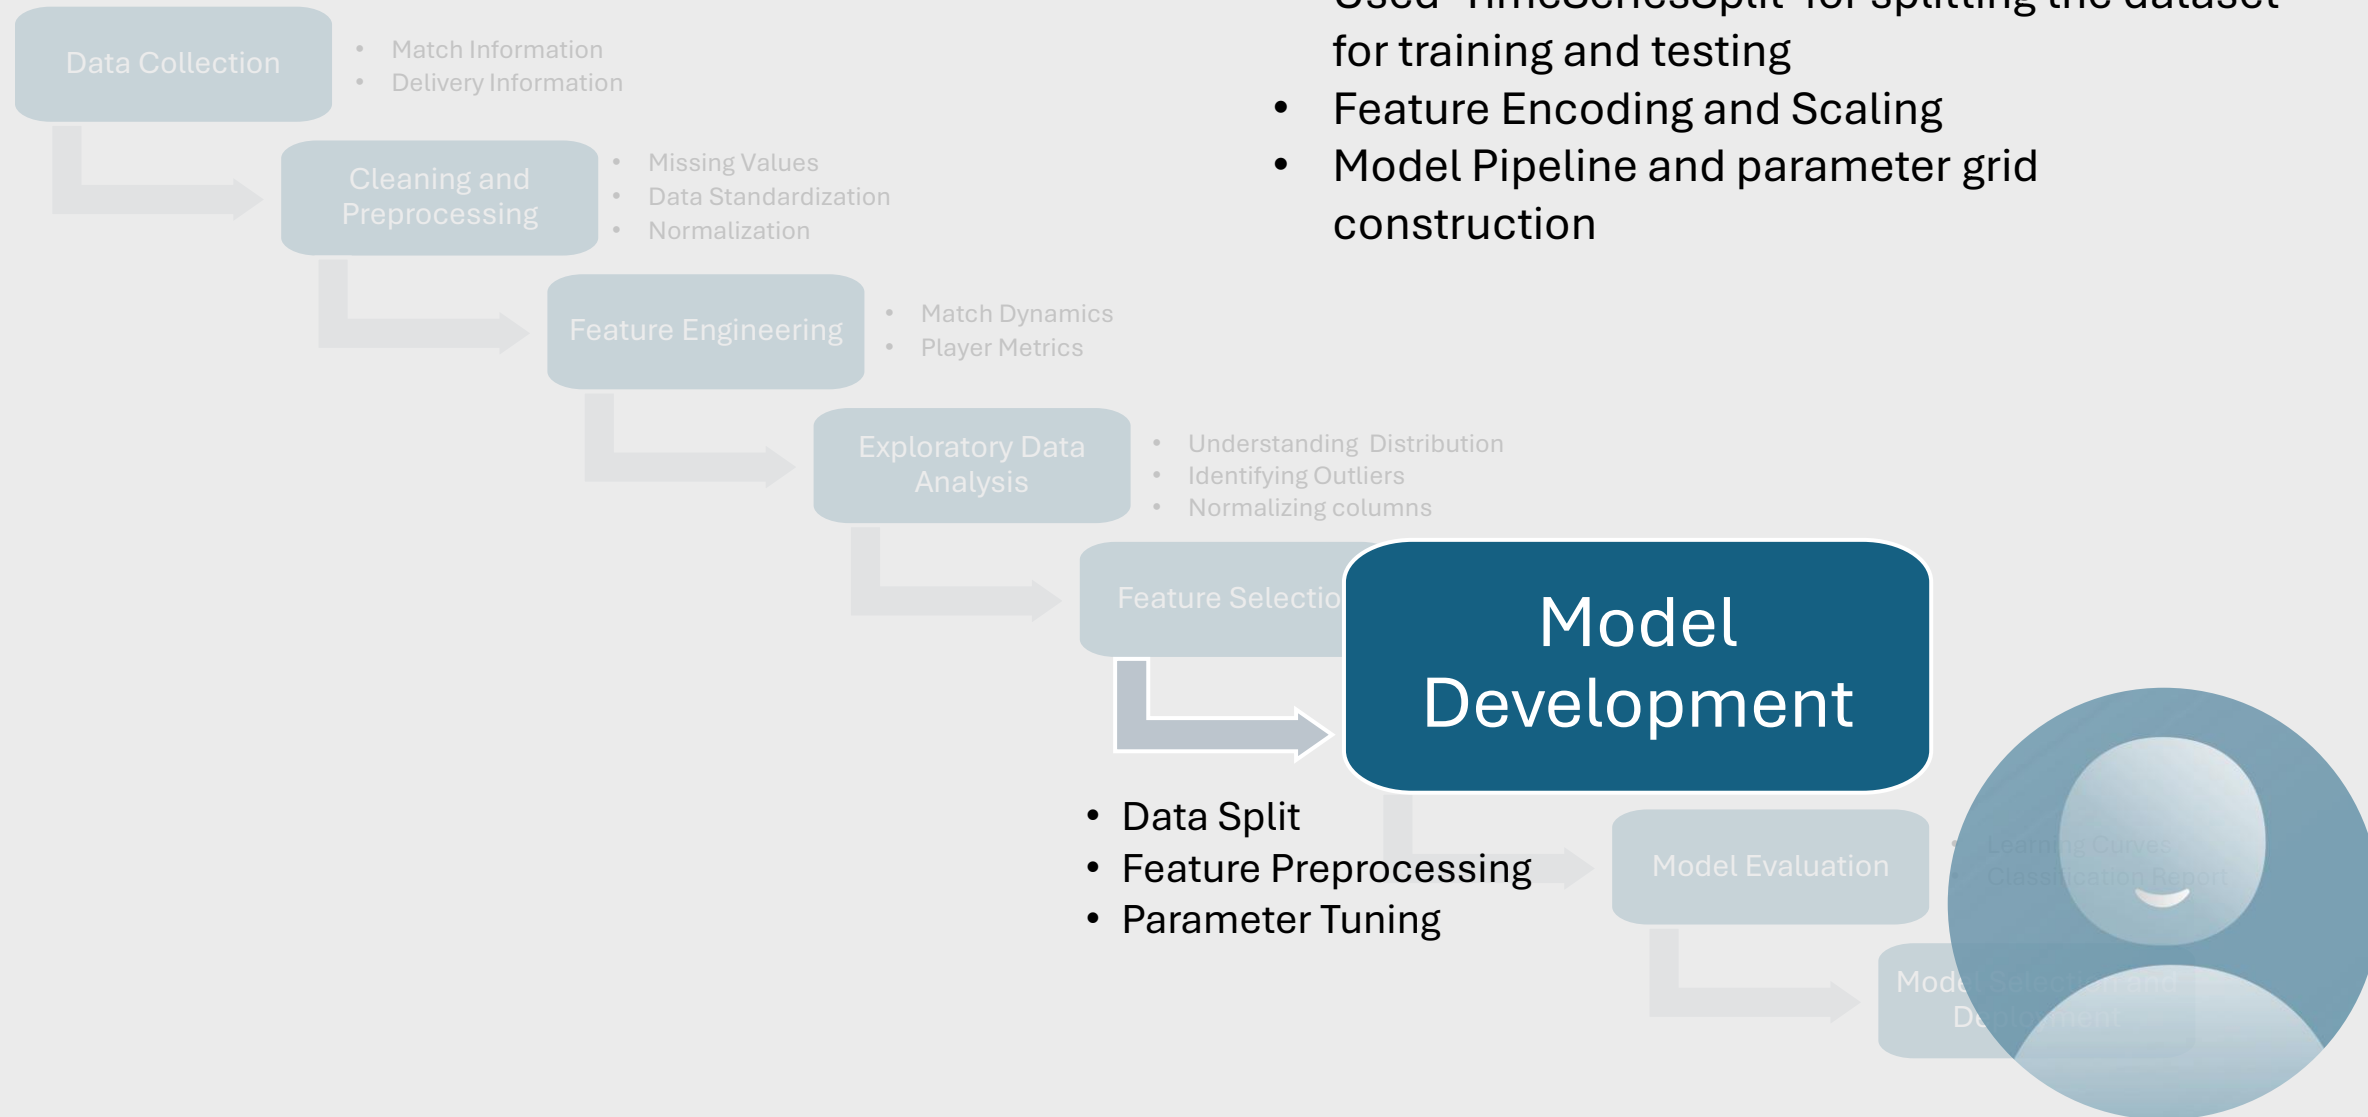

Feature Selection

- Match Environment Features such as Venue, Batting Team, Toss Winner
- Match characteristics and Momentum Features
- Batsman's match and all-time, and bowler's match statistics

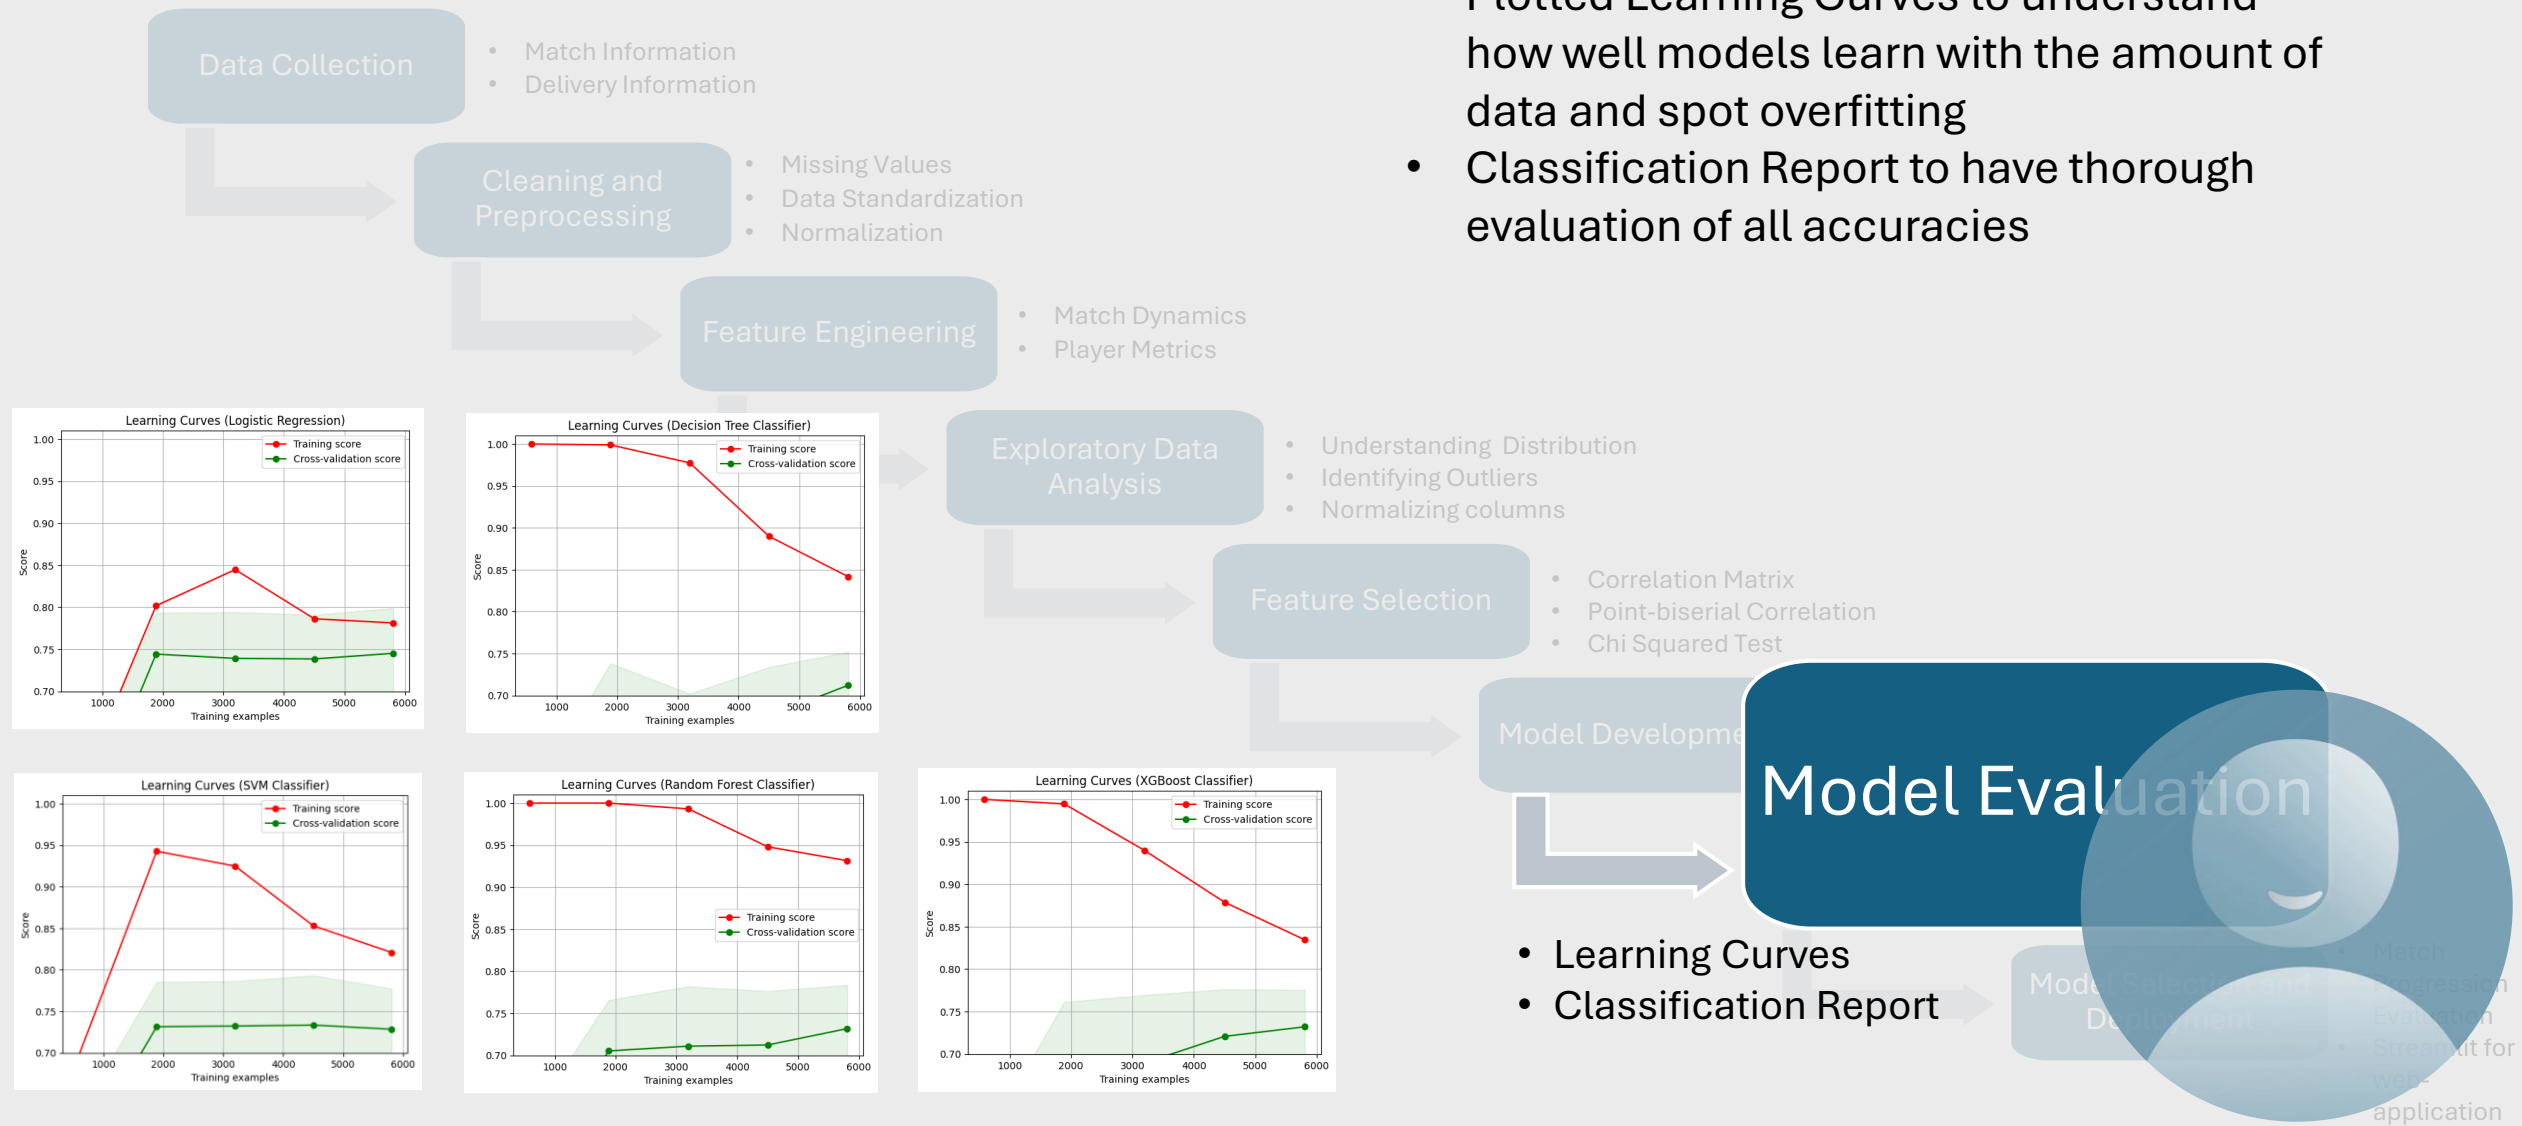

Data Modelling

- Used 'TimeSeriesSplit' for splitting the dataset for training and testing
- Feature Encoding and Scaling
- Model Pipeline and parameter grid construction

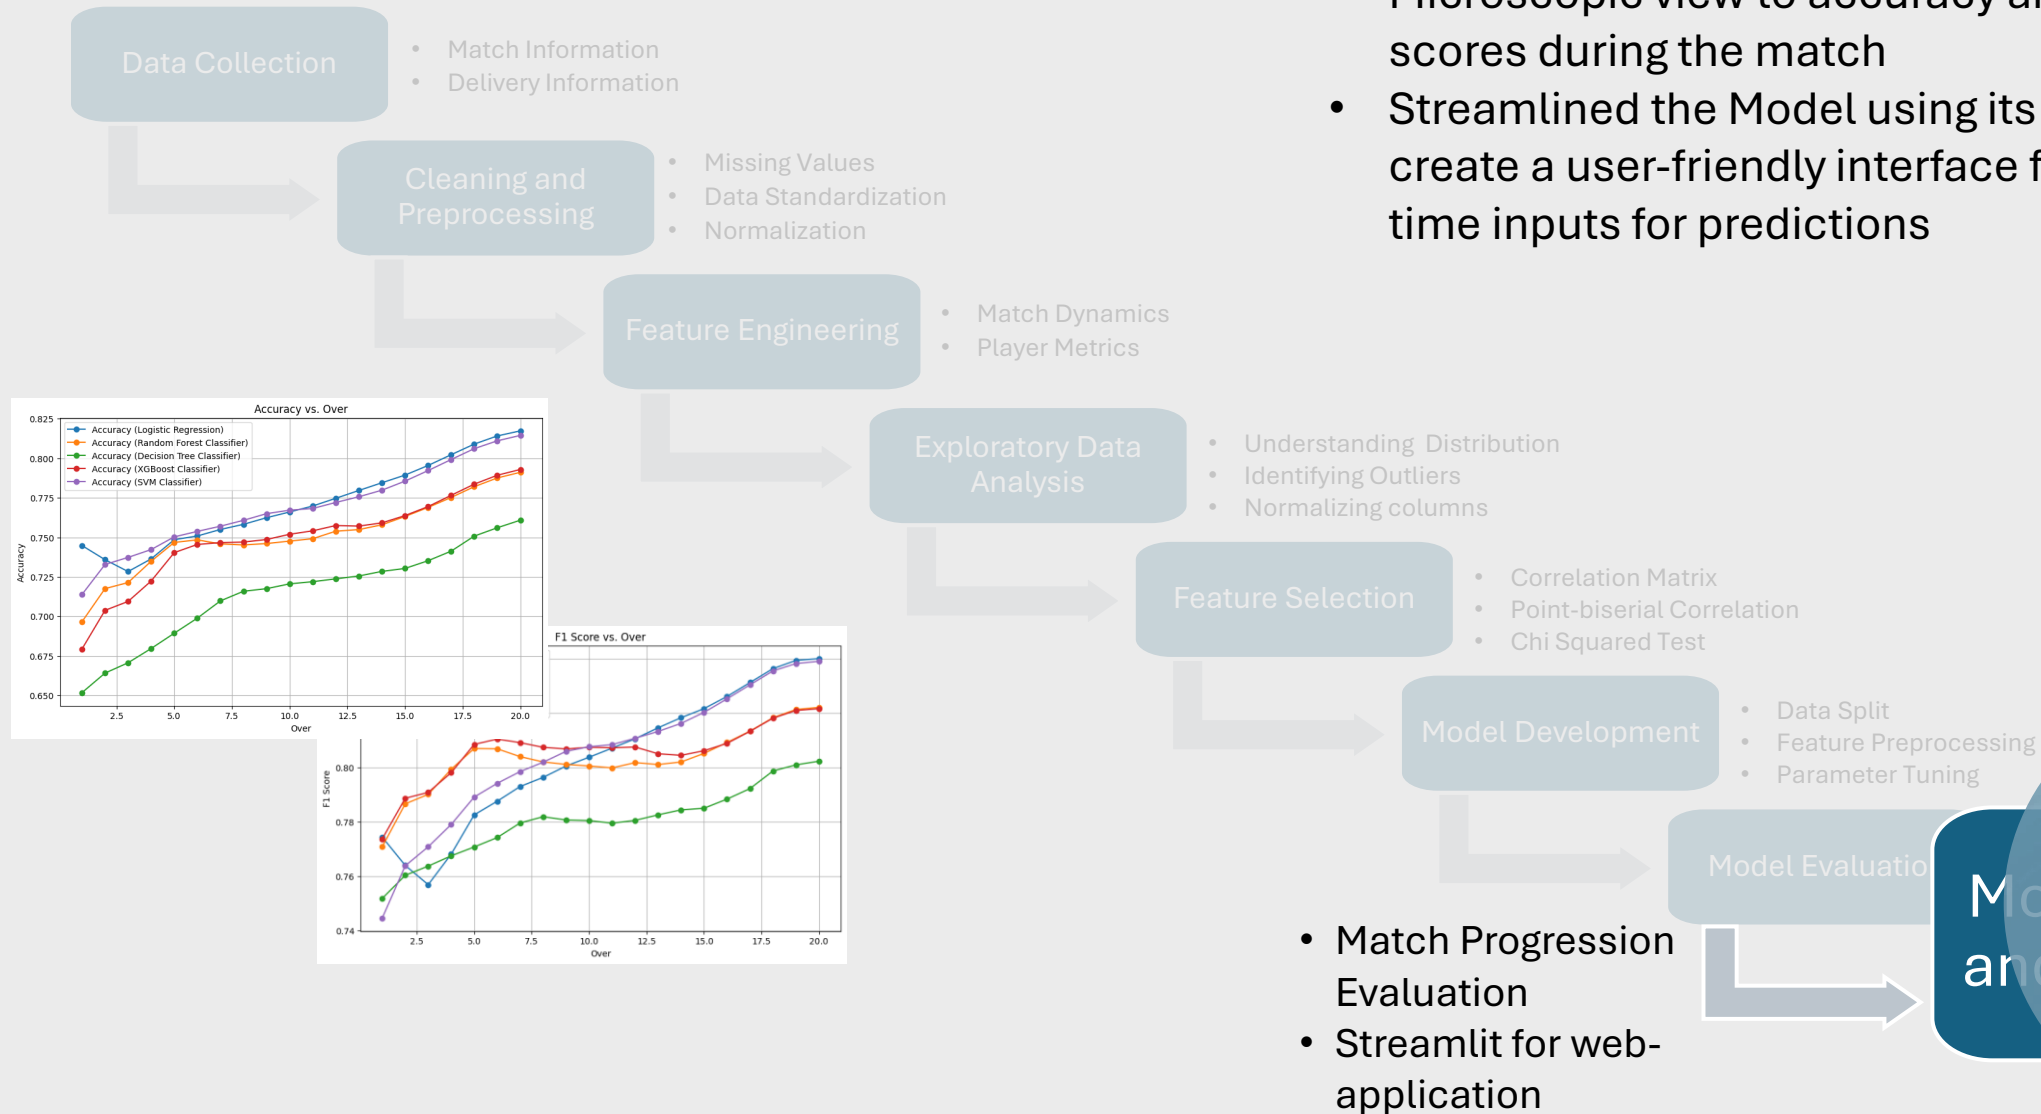

Evaluation Techniques

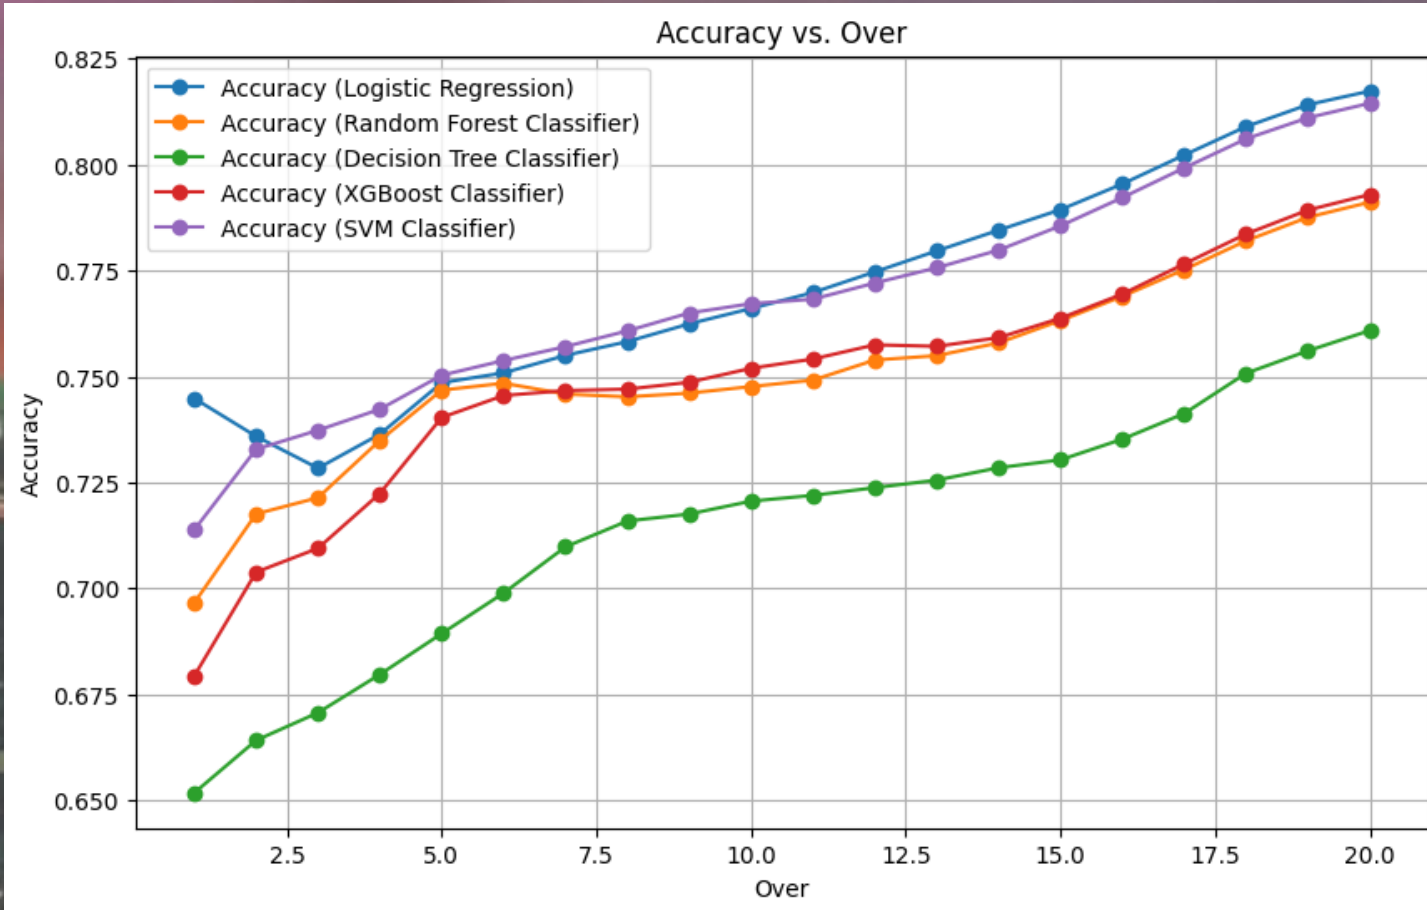

- Plotted Learning Curves to understand how well models learn with the amount of data and spot overfitting
- Classification Report to have thorough evaluation of all accuracies

Model Selection & Deployment

Results

- We can see the importance of factors such as venue, toss, etc.
- Provided cricket fans with insights
- Successfully demonstrated how machine learning can be used to predict match outcomes

Future Scope

- Web-scraping or use of APIs to collect live information and integrating other datasets
- Analysing over various types of dataset, such as image, player performance, etc.
- Predicting various different aspects such as injuries, score, player performance, etc.

Moments

Special Thanks To

Dr. Chengjia Wang for supervising this project

The background of the slide is a photograph of cricket equipment on a green grass field. A wooden cricket bat is positioned vertically on the left. A red cricket ball is at the bottom left. Several white cricket balls are scattered in the center and upper right. A semi-transparent white rectangular box with a thin black border is centered over the image.

Q&A?

The background of the slide is a photograph of cricket equipment on a green grass field. A wooden cricket bat is positioned vertically on the left. A red cricket ball is at the bottom left. Several white cricket balls are scattered on the grass. A semi-transparent white rectangular box with a thin black border is centered on the slide, containing the text 'Q&A?'.
